cross-study examining the relationship between gender and conflict management strategies reported weak or no significant results. This study aims to extend prior research by an interactive effects of gender on conflict management strategies over time. The authors propose that men and women differ in their conflict management strategies because of sex differences in negotiation theory and very over time based on the "generation" of the worker (i.e., Baby Boomer, Generation X, Generation Y, Generation Z).

To test the study hypotheses, a field study was conducted among employees in conflict-prone organizations. The dependent variables were conflict management, dominating, avoiding, and compromising. Questionnaire data were collected over four consecutive years from employees in three organizations.

Data analysis was performed using a multivariate

and a female gender employees who make higher conflict management strategies (integrating, avoiding, and compromising) than male employees. The results also show that men were more dominant (dominating) than female employees. All the main and interaction effects were significant. The results suggest that the conflict management strategies used by men and women in the USA, particularly at two major public universities, there may be implications for a more global workforce. However, the results support the notion advanced by face negotiation theory that men and women differ in their conflict management strategies.

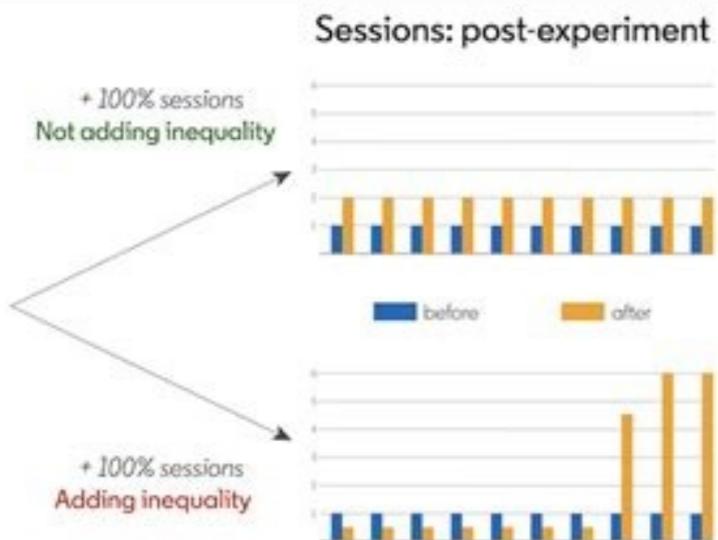

Implications – This study demonstrates that workers employ different conflict-management strategies based on their gender. Therefore, organizations should consider gender when selecting, training, and evaluating processes for managers. In addition, supervisors should encourage the use of conflict-resolution, integrating, avoiding, and compromising strategies in specific situations when appropriate strategic decisions are required.

Conclusion – By using face negotiation theory the framework to examine changes in conflict management strategies over time is proposed. The results of this study can help to better predict intent to influence the selection and use of conflict-management strategies in the

efficiency, Conflict management strategies, Face negotiation theory, Gender,

research paper

50 years, researchers and practitioners have been examining the role of organizations. The most common premise has been that conflict is a natural between individuals (and groups) and understanding conflict management (Kahn, 1985; Kahn, 1990; Kahn, 2001; Pelletier et al., 2008). The analysis has been made and validated that organizations should benefit but, rather, manage it to enhance individual, group and organizational Kahn, 1985, 2011).

BORDEAUX, C. and BRINLEY, A. (2009). Many scholars have argued that a domain environment of inequality and guitar results in a higher probability of state -owned use internationally. W., Brennan, R. The final sample consisted of 515 individuals, mainly (63%), were men, with the age of 40 years; They were all married to â € 20 or lived with a heterosexual partner and had children. 93, 901 - 911. This may indicate that women assimilate the conflict with their partner in conflict in Famâlia, that is, women integrate the couple into the concept of Famâlia, while men consider them different. This leads us to propose the hypothesis 4: H4: The conflict between partners due to the unequal distribution of domain tasks generates an increase in more Famâlia for labor conflicts (FWC) in women than in men because of your greatest involvement at home. But also the organizations can participate in this social change. However, we do not consider specific situations (ie, living in your home, living in a large city or a small town, the avam support in needy children, children's age) that can help us to better describe the sample and interpret our results. This scale includes only the most common domain tasks of a standard Spanish couple with school -age children, including others that may be less frequent in this culture (ie cut the grass). M., CASPER, W. Doi: 10.1037/10474-007 Crossref full text | Google Scholar Greenhaus, J. This result totally supports hypothesis 4. Mills (Cham: Springer), 3 - 19. Doi: 10.5465/AMR.2000.2791609 Crossref full text | Google Scholar Fernâ f ndez, J., Quiroga, M. The perception of the injustice is a factor between an uneven distribution of domestic work and the perceivedof the relationship; The relationship can be perceived as satisfactory, although the sharing of responsibilities is not equal, if it is not perceived unfair (Yago and Martânez, 2009). ¢ Conflict on household chores has been measured with the only question how many times you and your partner discuss about who should do domestic tasks and when? P. Table 4. In addition, public

and social institutions specialized in family issues should incorporate these progressive changes in traditional gender roles in their strategies in order to facilitate the homogenization of the roles of women and men in the family and workplace. Google Scholar Huang, Y. This is a self-built scale of 10 items that measures the self-perception of subjects about different tasks related to domestic tasks, family management and child care and education. 67, 169 - 198. I examine the role of gender domestic equality in predicting whether a state is or not more aggressive in international disputes. STUDY LIMITATIONS This study focuses on the effect of different types of conflicts related to home and work settings. H., Di Renzo, M. Alpha values meet the criterion of 0.70 (Nunnally and Bernstein, 1994), except in the case of the perception of partner involvement in domestic tasks, which was above 0.60. Subjects respond to each item using a yes/no dichotomous format about the perception of your partner's involvement in different family tasks. "La distribución del Trabajo Doméstico STICO y la percepción de Injusticia en Las Mujeres (Distribution of domestic work and perception of injustice in women), át@ nero y conciliación de la vida f laboral- & Conciliation of gender and work: a psychodocial analysis, ed. 58, 456 - 468. They do not consider them separate domains, but as a unitary and unbreakable in people's lives. BIRKEN, S. Sociol. This inequality of generation in the distribution of domain tasks and child care does not imply a higher higher WFC in women compared to men. 144, 284 € .314. These results may be related to the absence of perception of the injustice in the relationships with inequality in the distribution of domain and family responsibilities between men and women, so that in many cases as those Women do not perceive the injustice in their relationships or are dissatisfied. (2014). There is no differences in the perception of playing with children. DOI: 10.1007/S10183-017-9524-9 Cruise Ref Full Text | Google Scholar Pitt-Catsopoulos, M., Kosk, E. D., and Rosenthal, R. Kruskal & Wallis also confirm that women are significantly more involved than men in seven of the eleven domain tasks (see table 3). Differenties of generation in the fault of the work of work in parents of small children. E., Greenhaus, J. Workplace family support, parental satisfaction and work-family conflict: individual effects and crossover between Dual-Earner couples. A., and BlandChard, D., however, due to the lack of clear differences in the relative results in men and women when the implication of partners in the domain choir is high, it would be necessary include facilitation and synergy models that would make it more fanciful to understand the Famáli work relationship in all its facets, including the role played by the inequality of gain and gain. X., VOLLING, B. Labor and family interactions are incorporated into the cultural, institutional and broader economic context in which individuals reside (Olier-Malaterre and Foucault, 2017).
