Computer system architecture interview questions answers

Architecture Specification	Implementation
© The Open Group	
Irrelevant: The implementation has no features in common with the architecture specification (so the question of conformance does not arise).	
Consistent: The implementation has some features in common with the architecture specification, and those common features are implemented in accordance with the specification. However some features in the architecture specification are not implemented, and the implementation has other features that are not covered by the specification.	
Compliant: Some features in the architecture specification are not implemented, but all features implemented are covered by the specification, and in accordance with it.	
Conformant: All the features in the architecture specification are implemented in accordance with the specification, but some more features are implemented that are not in accordance with it.	
Fully Conformant: There is full correspondence between architecture specification and implementation. All specified features are implemented in accordance with the specification, and there are no features implemented that are not covered by the specification.	
Non-conformant: Any of the above in which some features in the architecture specification are implemented not in accordance with the specification.
